CLAIM AMENDMENTS

- 1. (original) An apparatus for heating or cooling a

 2 fluid in flexible tubing, the apparatus comprising:
 3 a body generally centered on an axis and having an outer
- surface formed with a radially outwardly open helicoidal groove of
- a cross-sectional shape generally corresponding to a cross-sec-
- tional shape of the tubing, whereby the tubing can be fitted to the
- groove in heat-exchange contact with the body, the outer surface
- being tapered axially such that substantially all of the groove can
- be seen from a point axially offset from the body; and
- means for heating or cooling the body.
- 2. (original) The apparatus defined in claim 1 wherein the outer surface is substantially frustoconical.
- 3. (original) The apparatus defined in claim 1 wherein the groove is of part-circular section.
- 4. (original) The apparatus defined in claim 1, further comprising
- means for mounting the body to an IV rack with the axis generally horizontal.

- 5. (currently amended) The apparatus defined in claim 1,

 further comprising An apparatus for heating or cooling a fluid in

 flexible tubing, the apparatus comprising:

 a body generally centered on an axis and having an outer
- surface formed with a radially outwardly open helicoidal groove of
- a cross-sectional shape generally corresponding to a cross-sec-
- tional shape of the tubing, whereby the tubing can be fitted to the
- groove in heat-exchange contact with the body, the outer surface
- being tapered axially such that substantially all of the groove can
- be seen from a point axially offset from the body;
- means for heating or cooling the body; and
- an annularly continuous insulating sleeve fitting snugly
 over the outer surface and radially outwardly closing the groove.
- 6. (original) The apparatus defined in claim 5, further comprising
- means for releasably securing the sleeve on the surface.
- 7. (original) The apparatus defined in claim 6, further comprising
- a hinge mounting the sleeve on the body.
